

The MacOS X version of the Agfa Scanwise software may give you an error message when you try to install it. If the error message states that the application program that created it could not be found, you will need to reset the file to the correct application. This can be done by following the steps outlined below:

- 1) Click on the downloaded ".dmg" file, then go to the File menu and select "Get Info".
- 2) Click on the "General Information" box and select the option "Open with Application".
- 3) If the icon in this window shows Disk Copy 10.1 to be the application that opens this file, then it does not need to be changed. If this is the case, you may have a bad download, and will need to redownload the file. However, if the window shows a different icon, click on the large icon of the currently selected application and select "Other".
- 4) The program will ask you to choose a program. You will need to select Disk Copy 10.1, which is found in the "Utilities" folder, in the Applications folder of the Macintosh HD. Once Disk Copy is selected, you can click on the Add button to make it the application that opens this file.

You can close the window and double click on the ".dmg" file now to install the Agfa Scanwise software.
